

This week we have focused on the creation of the models, besides being very busy with other courses. We created the following models:

- Requester - derived from User
- Worker – derived from User
- Campaign
- Task
- Item
- Annotation

Not all attributes are created just yet, but the attributes that are required for the features given in the slides should almost all be there. The next step will be to create the Site Views and their contents for each type of user, and add some basic routing for users to their corresponding home.

Issues/problems encountered:

We find it strange the way the relations are named. We are used to the UML standard where you can read like 0..N Person's have 1 Birthplace, which is Chen's notation according to WebRatio's tutorials. WebRatio uses the Min-Max / ISO standard (looked up at http://en.wikipedia.org/wiki/Entity%E2%80%93relationship_model), which is less intuitive.
